

Lesson 2.7

Solving Formulas and Literal Equations

A literal equation is an equation where most coefficients have been replaced by variables.

When you solve one, the result will look like a new equation.

So no, you will not get a simple, numerical solution with these.

Examples

1. Solve $x - 2y = 1$, for y

$$\begin{array}{r} \cancel{-x} \quad \quad \quad \cancel{-x} \\ \hline \cancel{-2}y = \frac{1-x}{-2} \\ \hline y = \frac{1-x}{-2} \rightarrow \frac{-1+x}{2} \end{array}$$

2. Solve $2m + n = 12$, for m

$$\begin{array}{r} \cancel{-n} \quad \quad \quad \cancel{-n} \\ \hline 2m = \frac{12-n}{2} \\ \hline m = 6 - \frac{1}{2}n \quad \text{or} \quad m = \frac{12-n}{2} \end{array}$$

3. Solve $gh - 5k = 10j$, for g

$$\begin{array}{r} \cancel{+5k} \quad \quad \quad \cancel{+5k} \\ \hline gh = \frac{10j + 5k}{h} \\ \hline g = \frac{10j + 5k}{h} \end{array}$$

4. Solve $9x - y = 12x$, for x

$$\begin{array}{r} \cancel{-9x} \quad \quad \quad \cancel{-9x} \\ \hline -y = \frac{3x}{3} \\ \hline \frac{-y}{3} = x \end{array}$$

5. Solve $\frac{8cd - m}{10} = -2$, for c

$$\frac{8cd - m}{10} = -2$$

$$\begin{array}{r} 8cd - m \\ +m \quad +m \\ \hline \end{array}$$

$$\frac{8cd}{8d} = \frac{-20 + m}{8d}$$

$$c = \frac{-20 + m}{8d}$$

6. Solve $-12n + m = rt - 4n$, for n

$$\begin{array}{r} -12n + m \\ +12n \quad +12n \\ \hline \end{array}$$

$$m = rt + 8n$$

$$\begin{array}{r} m \\ -rt \quad -rt \\ \hline \end{array}$$

$$\frac{m - rt}{8} = \frac{8n}{8}$$

$$\frac{m - rt}{8} = n$$
